

Providing Complete Distribution Function Analysis with NUBEAM FGen

Casey Stark, Doug McCune, and Eliot
Feibush

Presentation by Casey Stark

Distribution Functions

Who cares?

You guys!

Simulated distribution functions help us understand...

- Fast-ion collective effects which can drive MHD instabilities
- RF wave-particle interactions (specifically ion RF heating)
- Comparison of numerical simulation to measured data

...and complete distribution function data can be used as initial conditions for other simulations.

TRANSP

From the TRANSP web page:

TRANSP is a time dependent transport analysis code for tokamak experiments.

TRANSP is basically a collection of command line programs that simulate tokamak plasmas.

Input: experimental data from tokamak shots

Output: useful data that cannot be measured, but can be simulated

This is awesome

TRANSP DF Generation

TRANSP can produce the full distribution function of all Monte Carlo particles in the simulation in energy, pitch, x , and θ space. But there are two ways to do this:

Run TRANSP and specify times of interest in the namelist

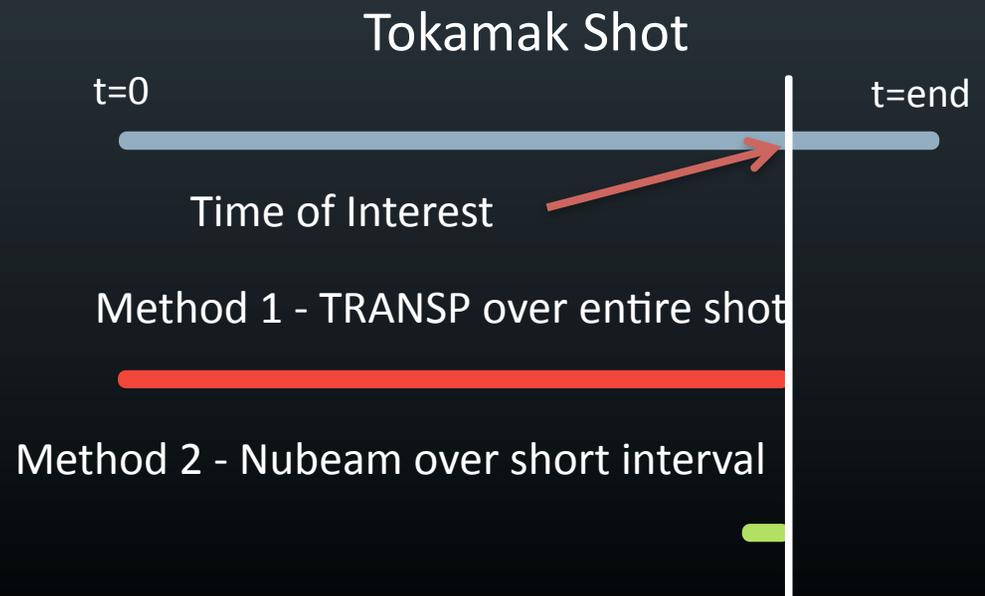

Pros: You just run TRANSP

Cons: Locks in your choices of toi's

Run TRANSP, extract plasma state at the time of interest, re-simulate deposition over a short time span

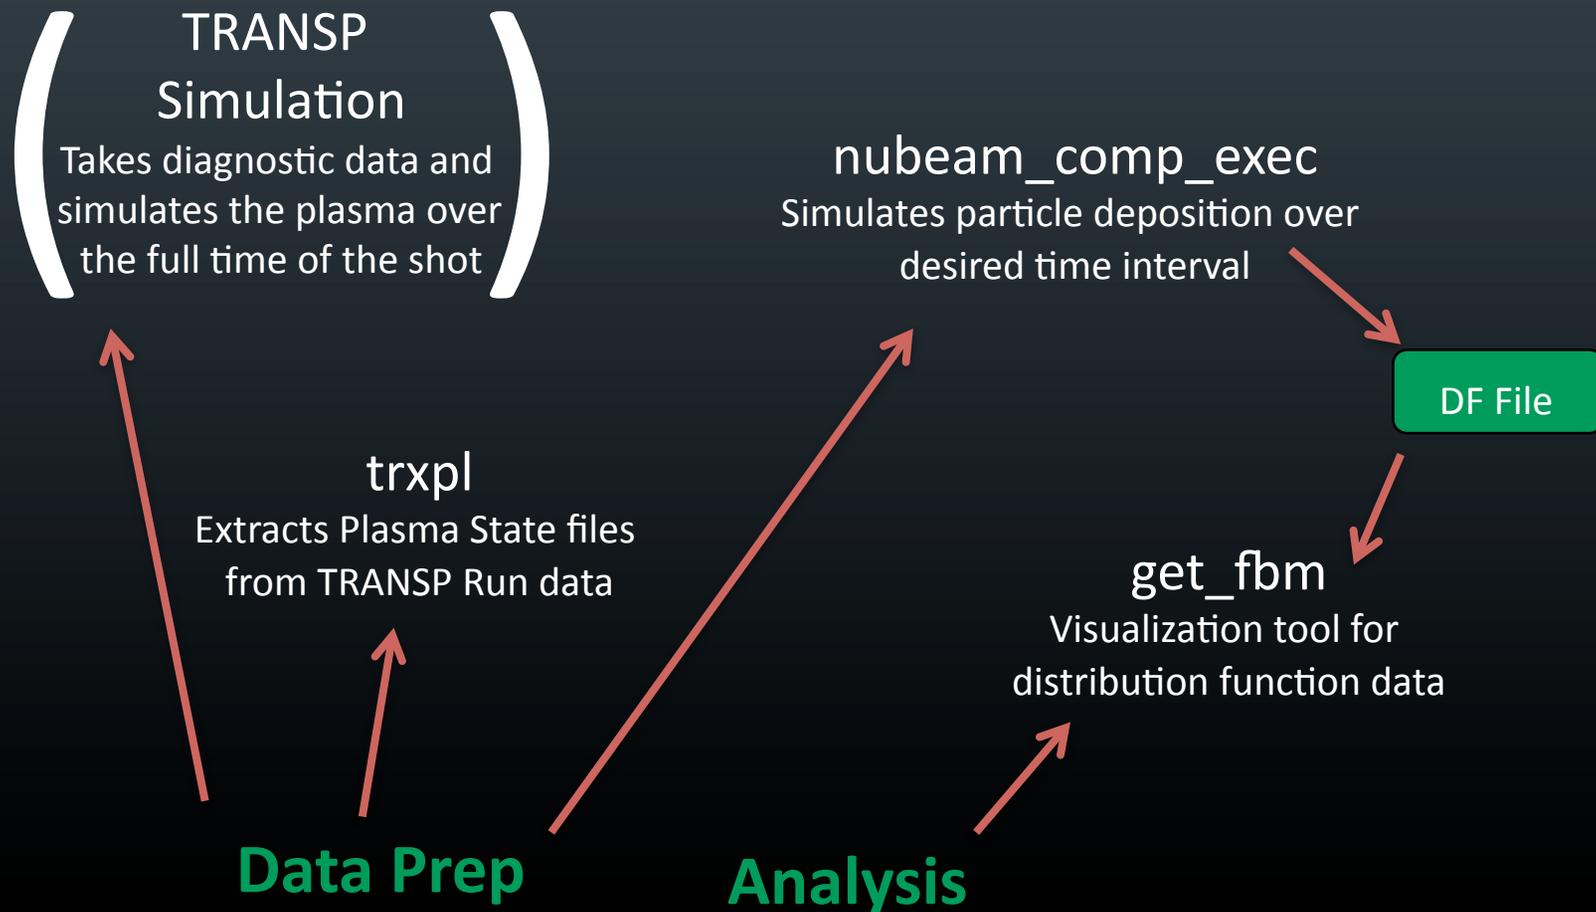

Pros: Very flexible

Cons: A longer process, but only if TRANSP hasn't been run

NUBEAM FGen DF Analysis

This is a complicated process using 4 separate programs

The Catch

TRANSP is a very powerful tool for tokamak plasma research, but also presents a steep learning curve.

Now What?

The Solution: Java Front-end
ELVis scientific graphic display

NUBEAM FGen is one of the newest ELVis
internal desktop applications.

Introducing NUBEAM FGen

By lines of code:

1255 - GUI built into ELVis	}	Java
361 - Manager class		
83 - Servlet functions		
352 - Server-side scripts	}	Python
74 - 'Glue' files	}	Cshell

Total: 2125

NUBEAM FGen

Job Submission Panel

Connects to an MDS+ Server to retrieve TRANSP data (uses B Bariteau's MDSPanel class)

Users can:

Browse TRANSP Run using an interactive RPLOT Session

Produce plots at the given time of interest (using RPLOT)

Submit Job

Instant Parallelization!

NUBEAM FGen

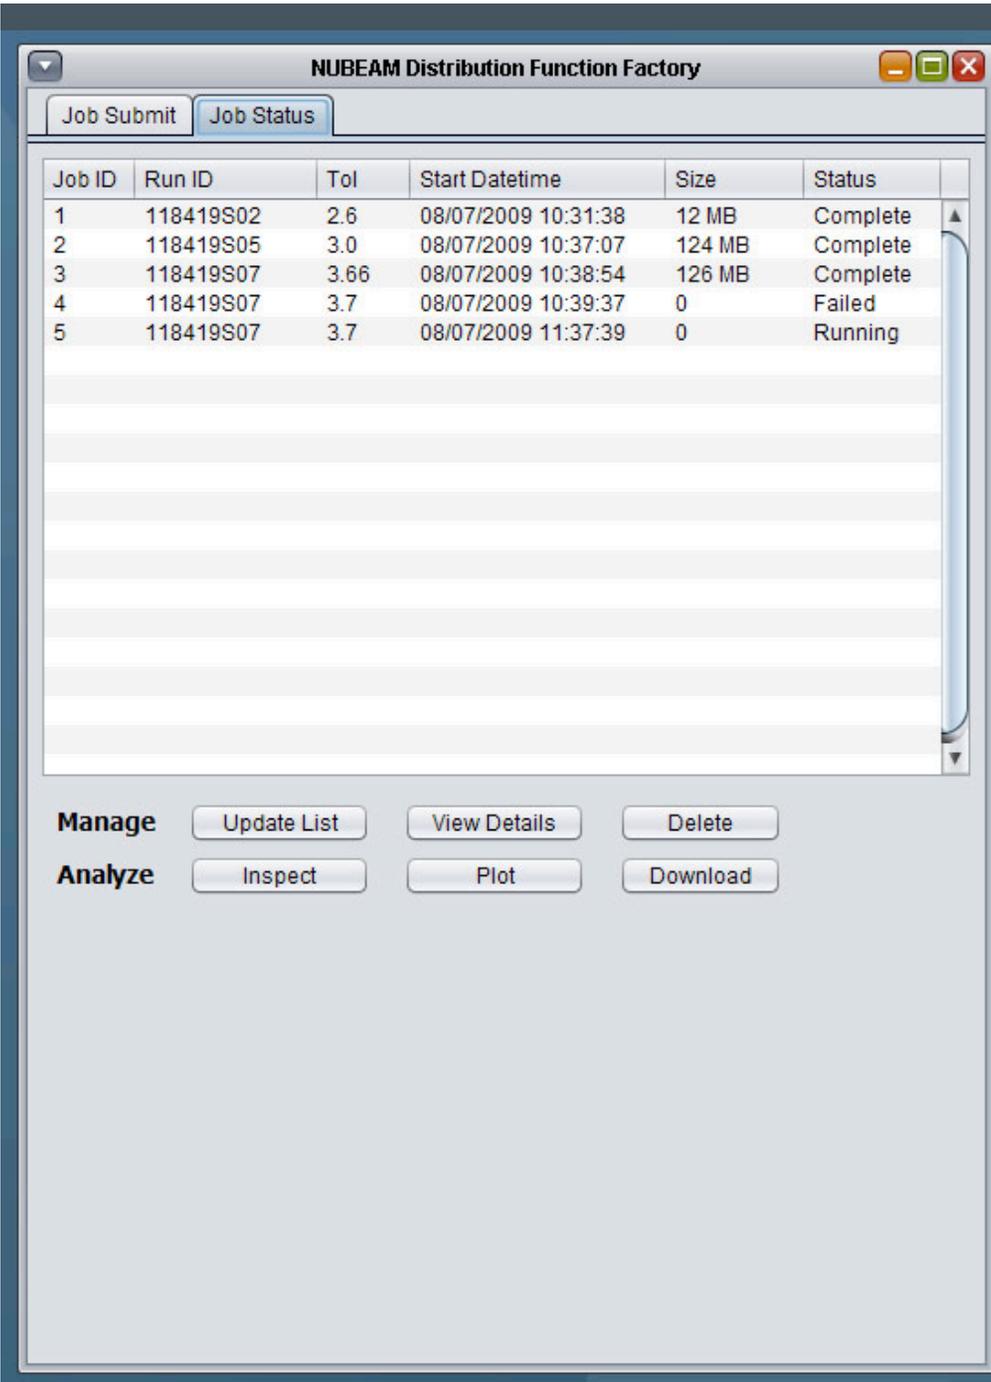

Job Status Panel

NUBEAM simulations take anywhere from 10 minutes to hours. Users must be able to monitor runs and come back to them.

FGen jobs are stored in a flat file database which is (partially) loaded into the history table.

Users can select a run and

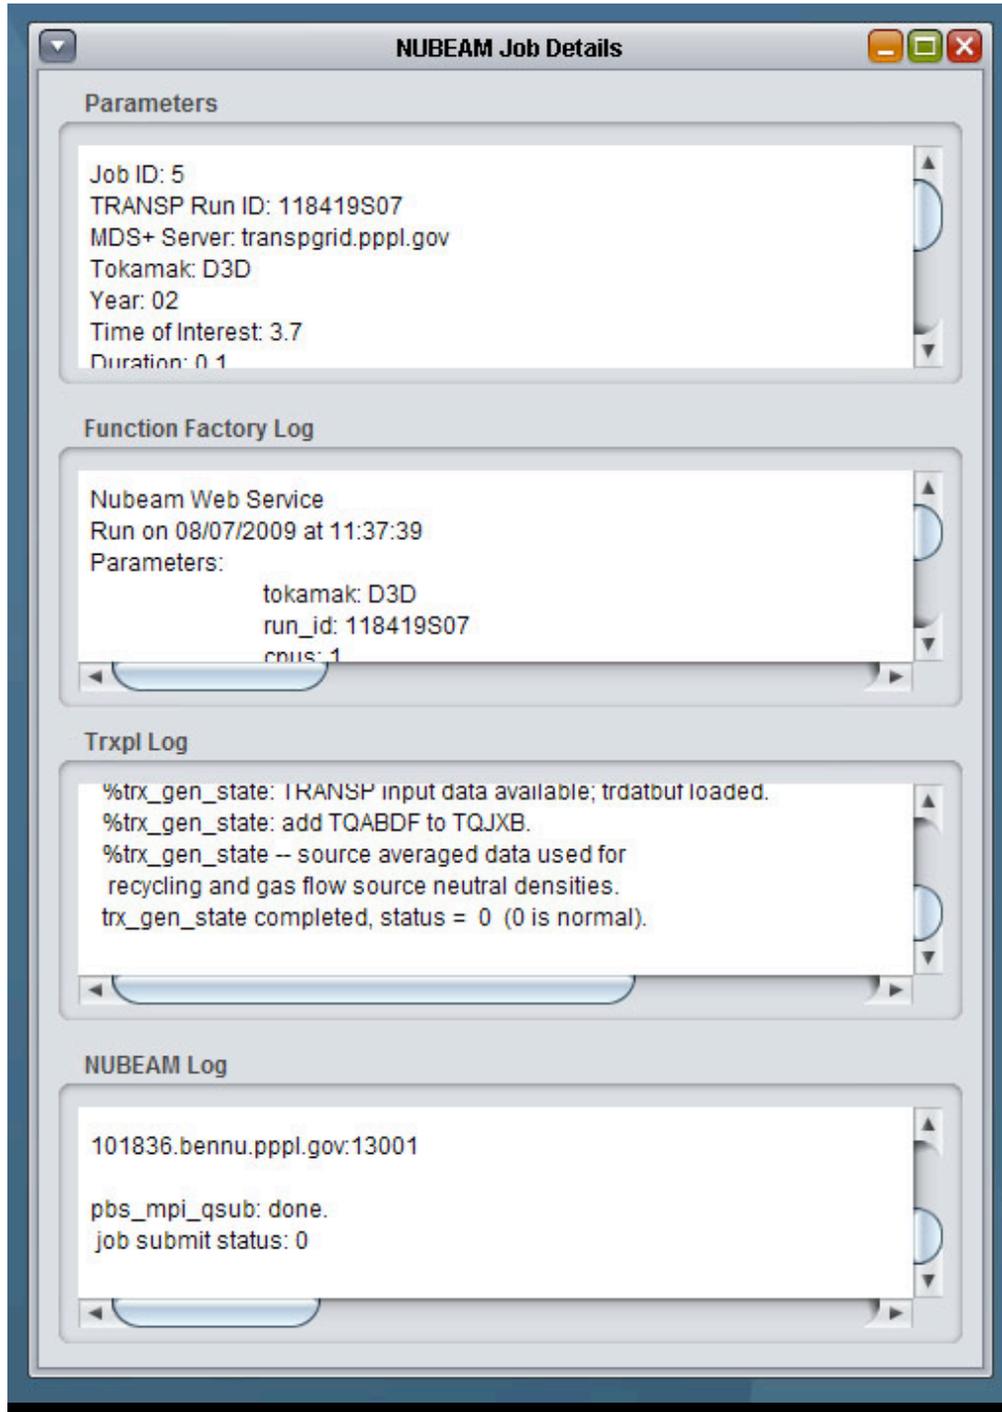

- Open in get_fbm
- Plot
- Download
- Delete

Job ID	Run ID	Tol	Start Datetime	Size	Status
1	118419S02	2.6	08/07/2009 10:31:38	12 MB	Complete
2	118419S05	3.0	08/07/2009 10:37:07	124 MB	Complete
3	118419S07	3.66	08/07/2009 10:38:54	126 MB	Complete
4	118419S07	3.7	08/07/2009 10:39:37	0	Failed
5	118419S07	3.7	08/07/2009 11:37:39	0	Running

Manage

Analyze

NUBEAM FGen

Job Detail Frame

The backend of NUBEAM FGen (TRANSP programs) can break occasionally and we need to deal with that.

Loads all parameters for selected job from db and all log files created by runNubeam web service.

Allows users to help the TRANSP developers in the debugging process

get_fbm

ELVIS CLIENT

Servlets and Scripts

Java UML

Singleton!

Summary

- (One of the) Newest ELVis applications
- Successfully creates full DF files (NetCDF)
- Provides complete monitoring/management tools
- Python and Java are well-documented (inline comments)
